Sustainability of the chicken supply chain in Lebanon: An evaluation system

Rodrigue EL BALAA and Christine TANNOURY

Email: rodrique.elbalaa@balamand.edu.lb

EAAP 2014 Copenhagen, Denmark, 25-29 August 2014
65th annual meeting of the European Federation of Animal Science

- **Status of Lebanese chicken industry**

- Enough production to satisfy private consumption and export frozen product around the Middle East
- 200 farms for table eggs and 1000 farms for broilers, producing seven million eggs and 180 million broilers per year respectively (Freiji, 2008)

- **Difficulties**

- High production cost
- Volatile feed cost
- High solid waste, water depletion, GHG production (IFC, 2007)

- **Proposed approach**

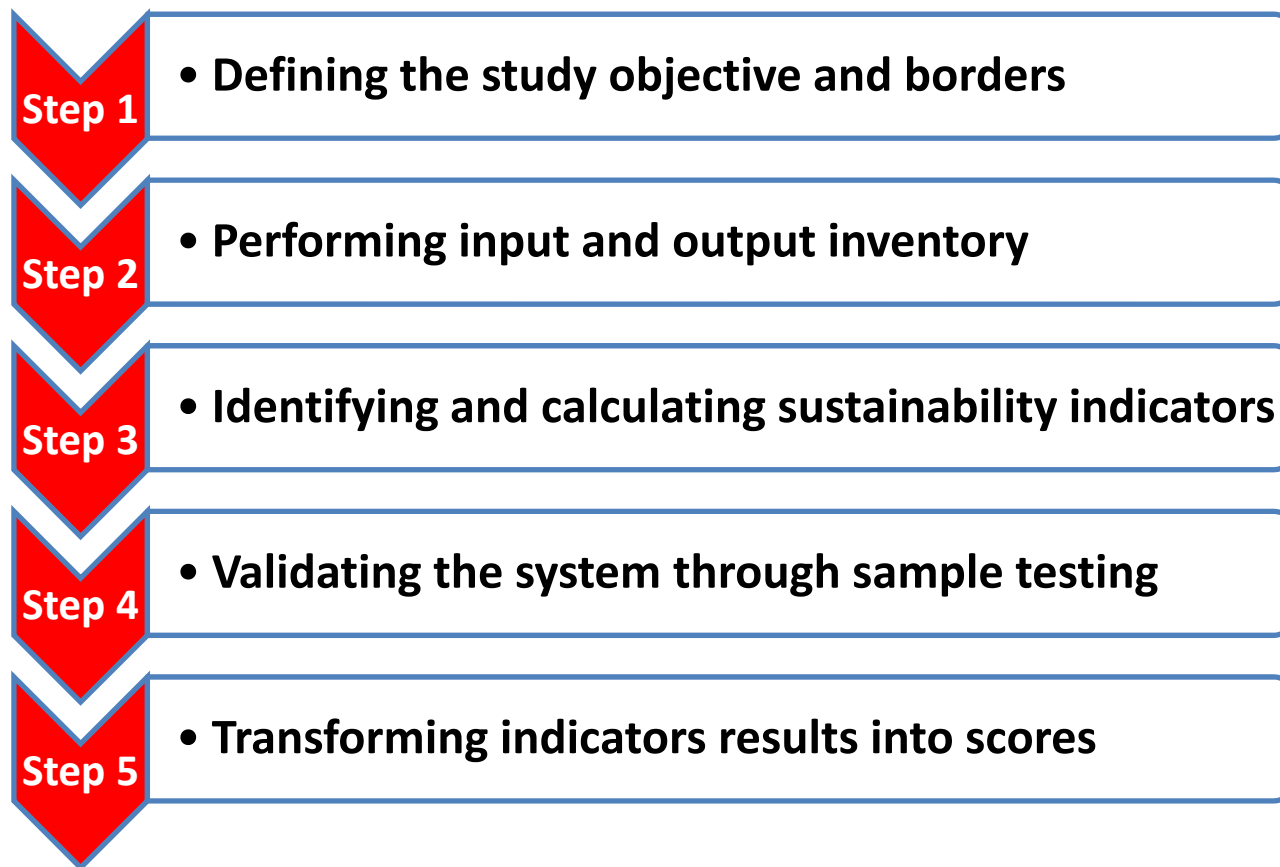

- A multifaceted problem requires a multidisciplinary approach
- Horizontally (environmental, economic and social), **sustainability**
- Vertically to include the supply chain actors (farmers, processors and distributors) **supply chain**

- **Objectives**

- Setting up an evaluation system of the **sustainability** of the chicken production **supply chain**
- Validation through testing

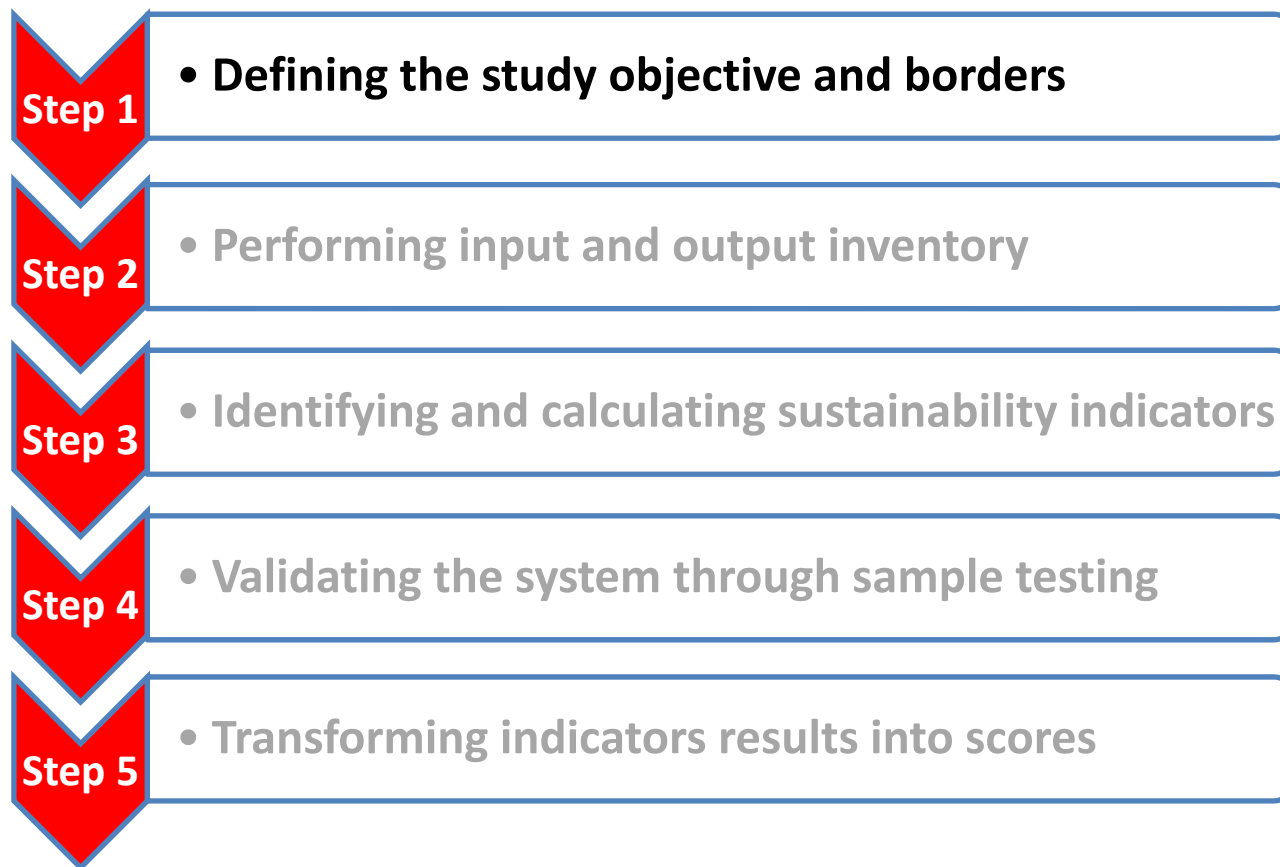

Building the evaluation system: a Life Cycle Analysis Approach

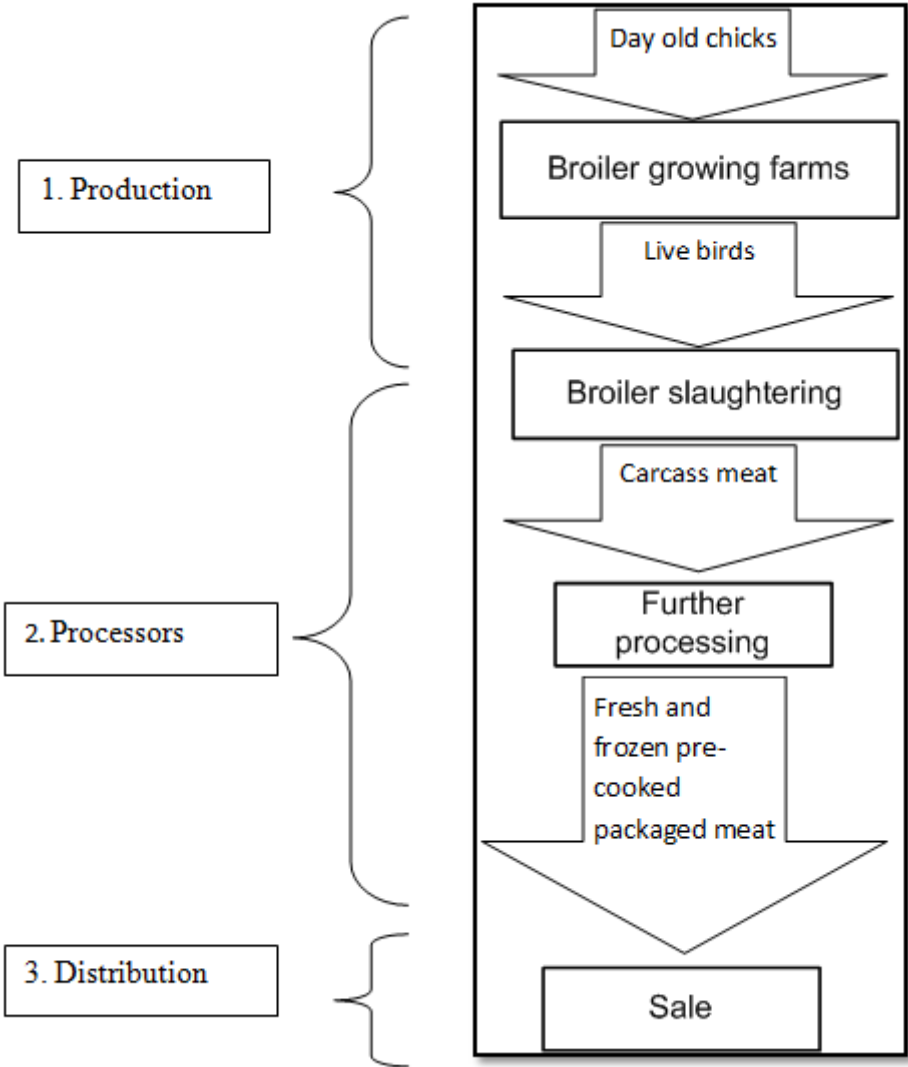

Building the evaluation system: a Life Cycle Analysis Approach

Step 1 • Defining the study objective and borders

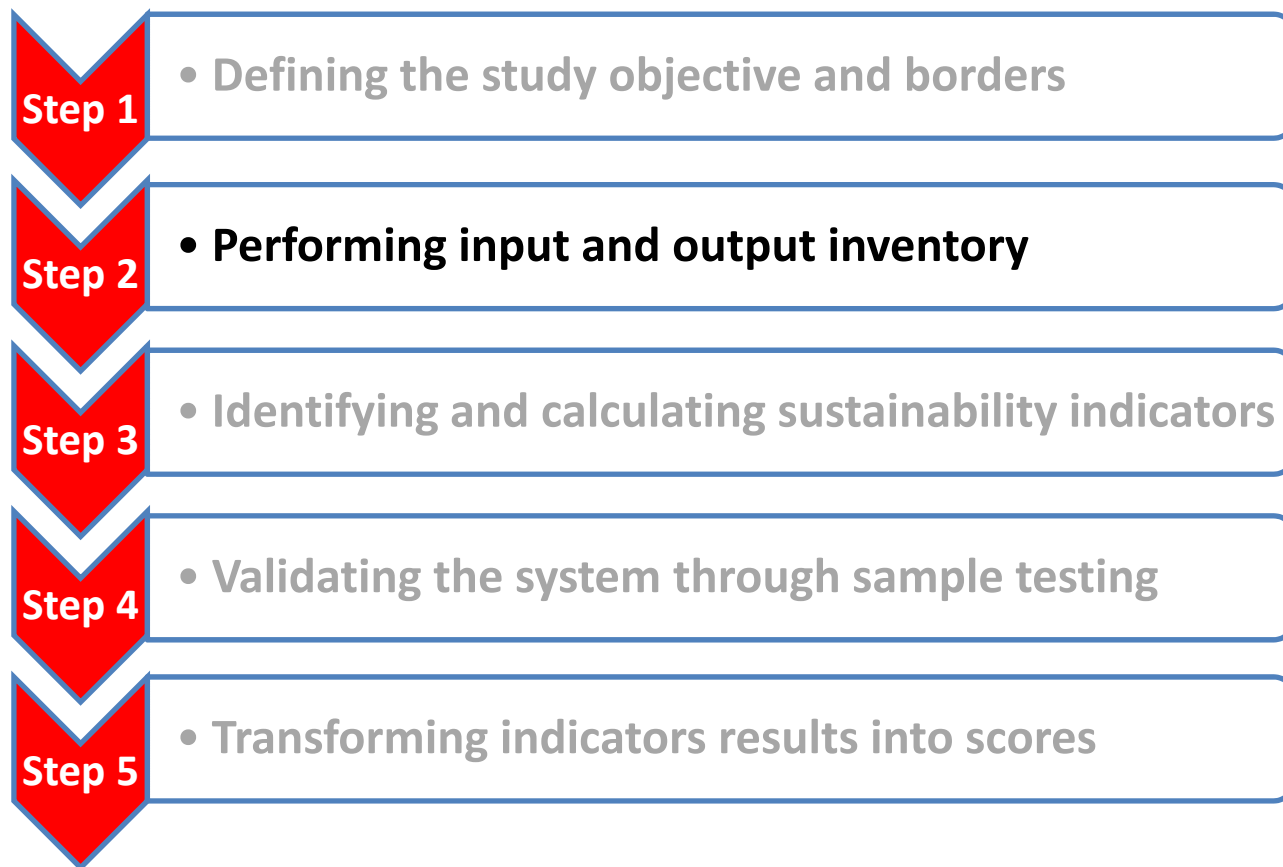

Supply chain actors:

- Producers
- Processors
- Distributors

Functional Unit
(Kg of edible meat)

Building the evaluation system: a Life Cycle Analysis Approach

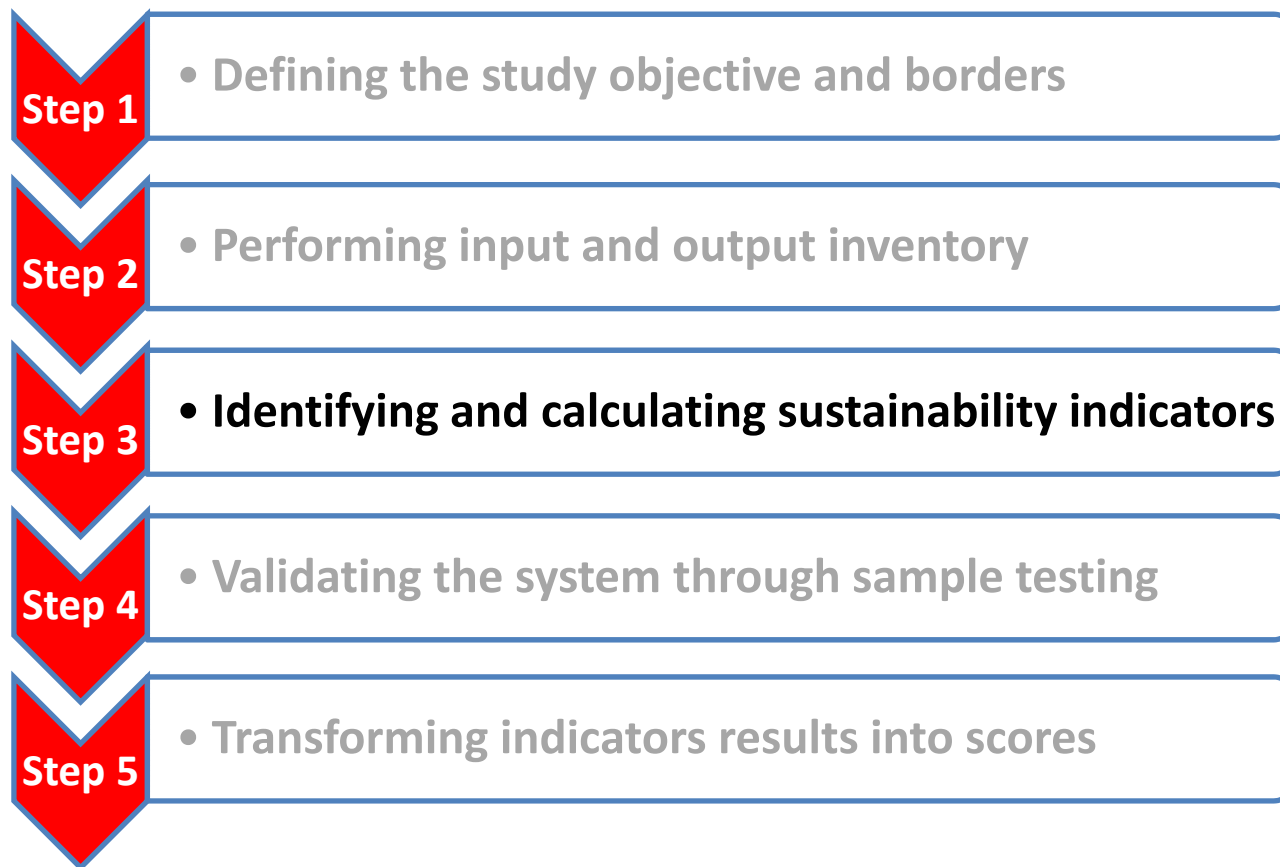

Step 2 • Performing input and output inventory

Level	Input	Output
Production	<ul style="list-style-type: none"> • Feed • Water • Energy • Medicine • Bedding • Equipment 	<ul style="list-style-type: none"> • Air emissions • Wastewater • Manure • fallen stock • Waste • Birds
Processing	<ul style="list-style-type: none"> • Water • Energy • Chemicals • Raw material (birds) • Equipment 	<ul style="list-style-type: none"> • Air emissions • Wastewater • Animal products • Solid waste
Distribution	<ul style="list-style-type: none"> • Water • Energy • Chemicals • Equipment 	<ul style="list-style-type: none"> • Air emissions • Wastewater • Solid waste

Building the evaluation system: a Life Cycle Analysis Approach

1. Introduction

2. Materials and Method

3. Results

4. Discussion

5. Conclusion

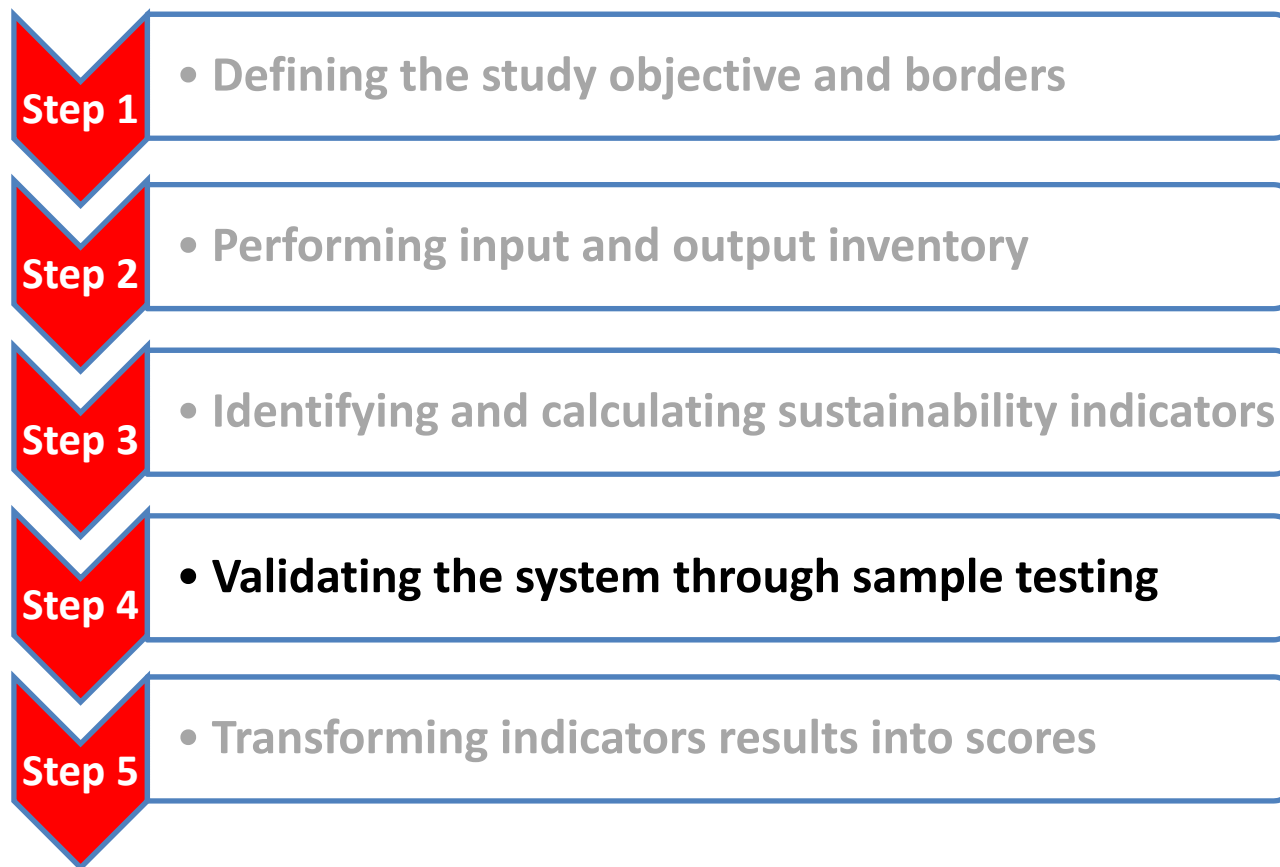

Step 3

- Identifying and calculating sustainability indicators

	Variables	Measuring Unit	Supply Chain level		
			Production	Processing	Distribution
Environmental	1) Energy	MJ/ kg	- Electricity - Transportation	- Electricity - Transportation	Electricity
	2) GHG emission	g CO ₂ /kg	- Electricity - Animal activity - Transportation	- Electricity - Transportation - Boilers	Electricity
	3) Nitrogenous effluents	L / kg	- Animal drinking - Cleaning - Cooling	- Cleaning - Cooling - Cooking	NA
	4) Water consumption	g/ kg	- Manure - Dead birds	- Wastewater treatment - Offal and viscera	NA
	5) Packaging material	g/kg	- Feed packs	- Cartons and nylon	Nylon bags
Social	6) Equity	% of women	Applied at all levels		
	7) Salary	LBP / year	Applied at all levels		
	8) Employees turn-over or rotation rate	Average of working years	Applied at all levels		
	9) Training	Number of trainings per year	Applied at all levels		
	10) Age	Mean age of workers			
	11) Working environment security	% of injuries	Applied at all levels		
Economic	12) Productivity	Kg/HWU	Applied at all levels		
	13) Profit growth	%	Applied at all levels		
	14) Yearly investment	%	Applied at all levels		
	15) Added value	%	Applied at all levels		

Building the evaluation system: a Life Cycle Analysis Approach

- Step 4**
- Validating the system through sample testing

Questionnaire (40 questions), four sections:

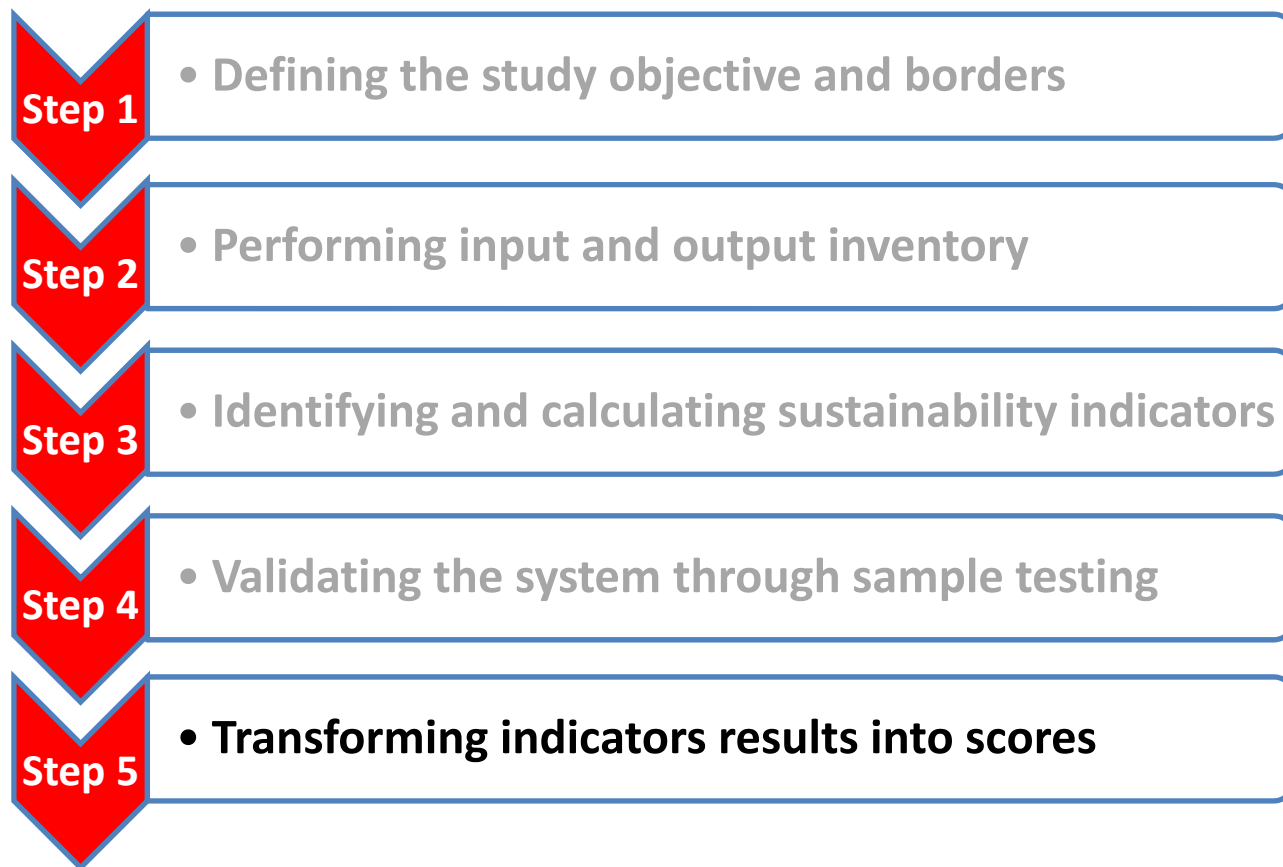

- 1. General information** (name, the date of opening, the number of employees, etc.)
- 2. Environmental issues** (energy consumption for production and transportation, water consumption, chemical detergents, organic effluents etc.
- 3. Social conditions** (salary for blue and white collars, rotation rate, average age of workers, etc.
- 4. Economical data** (productivity, added value, profit growth, internal investment, etc.)

Sample interviewees

- Two major producers with large market segments
- two processors
- five distributors.

Building the evaluation system: a Life Cycle Analysis Approach

- Transforming indicators results into scores

Score ranging between 0 and 10

	Indicator	Acronyms	0	1	2	3	4	5	6	7	8	9	10	
Environmental	Energy (MJ/Kg)	ENV-ENG	$x \geq 250$	$250 > x \geq 220$	$220 > x \geq 200$	$200 > x \geq 150$	$150 > x \geq 100$	$100 > x \geq 80$	$80 > x \geq 60$	$60 > x \geq 20$	$20 > x \geq 10$	$10 > x \geq 5$	$5 > x$	
	Green House Gases (g/kg)	ENV-GHG	$x \geq 290$	$290 > x \geq 260$	$260 > x \geq 200$	$200 > x \geq 100$	$100 > x \geq 50$	$50 > x \geq 25$	$25 > x \geq 20$	$20 > x \geq 15$	$15 > x \geq 10$	$10 > x \geq 5$	$5 > x$	
	Effluents (g/Kg)	ENV-N	$x \geq 30$	$30 > x \geq 25$	$25 > x \geq 20$	$20 > x \geq 10$	$10 > x \geq 5$	$5 > x \geq 2.5$	$2.5 > x \geq 2$	$2 > x \geq 1.5$	$1.5 > x \geq 1$	$1 > x \geq 0.5$	$0.5 > x$	
	Water (L/Kg)	ENV-WAT	$x \geq 20$	$20 > x \geq 15$	$15 > x \geq 10$	$10 > x \geq 8$	$8 > x \geq 6$	$6 > x \geq 4$	$4 > x \geq 2$	$2 > x \geq 1.5$	$1.5 > x \geq 1$	$1 > x \geq 0.5$	$0.5 > x$	
	Packaging (kg/kg)	ENV-PACK	$x \geq 5$	$5 > x \geq 4.5$	$4.5 > x \geq 4$	$4 > x \geq 3.5$	$3.5 > x \geq 3$	$3 > x \geq 2.5$	$2.5 > x \geq 2$	$2 > x \geq 1.5$	$1.5 > x \geq 1$	$1 > x \geq 0.5$	$0.5 > x$	
Social	Equity (%)	SOC-EQU	$0 \leq x < 10$ $100 \geq x \geq 90$	$10 \leq x < 15$ $90 > x \geq 85$	$15 \leq x < 20$ $85 > x \geq 80$	$20 \leq x < 25$ $80 > x \geq 75$	$25 \leq x < 30$ $75 > x \geq 70$	$30 \leq x < 32.5$ $67.5 > x \geq 70$	$32.5 \leq x < 35$ $67.5 > x \geq 65$	$35 \leq x < 37.5$ $65 > x \geq 62.5$	$37.5 \leq x < 40$ $60 > x \geq 62.5$	$40 \leq x < 45$ $60 > x \geq 55$	$45 \leq x < 50$ $55 > x \geq 50$

Acceptability Benchmark

1. Unit sustainability performance scoring

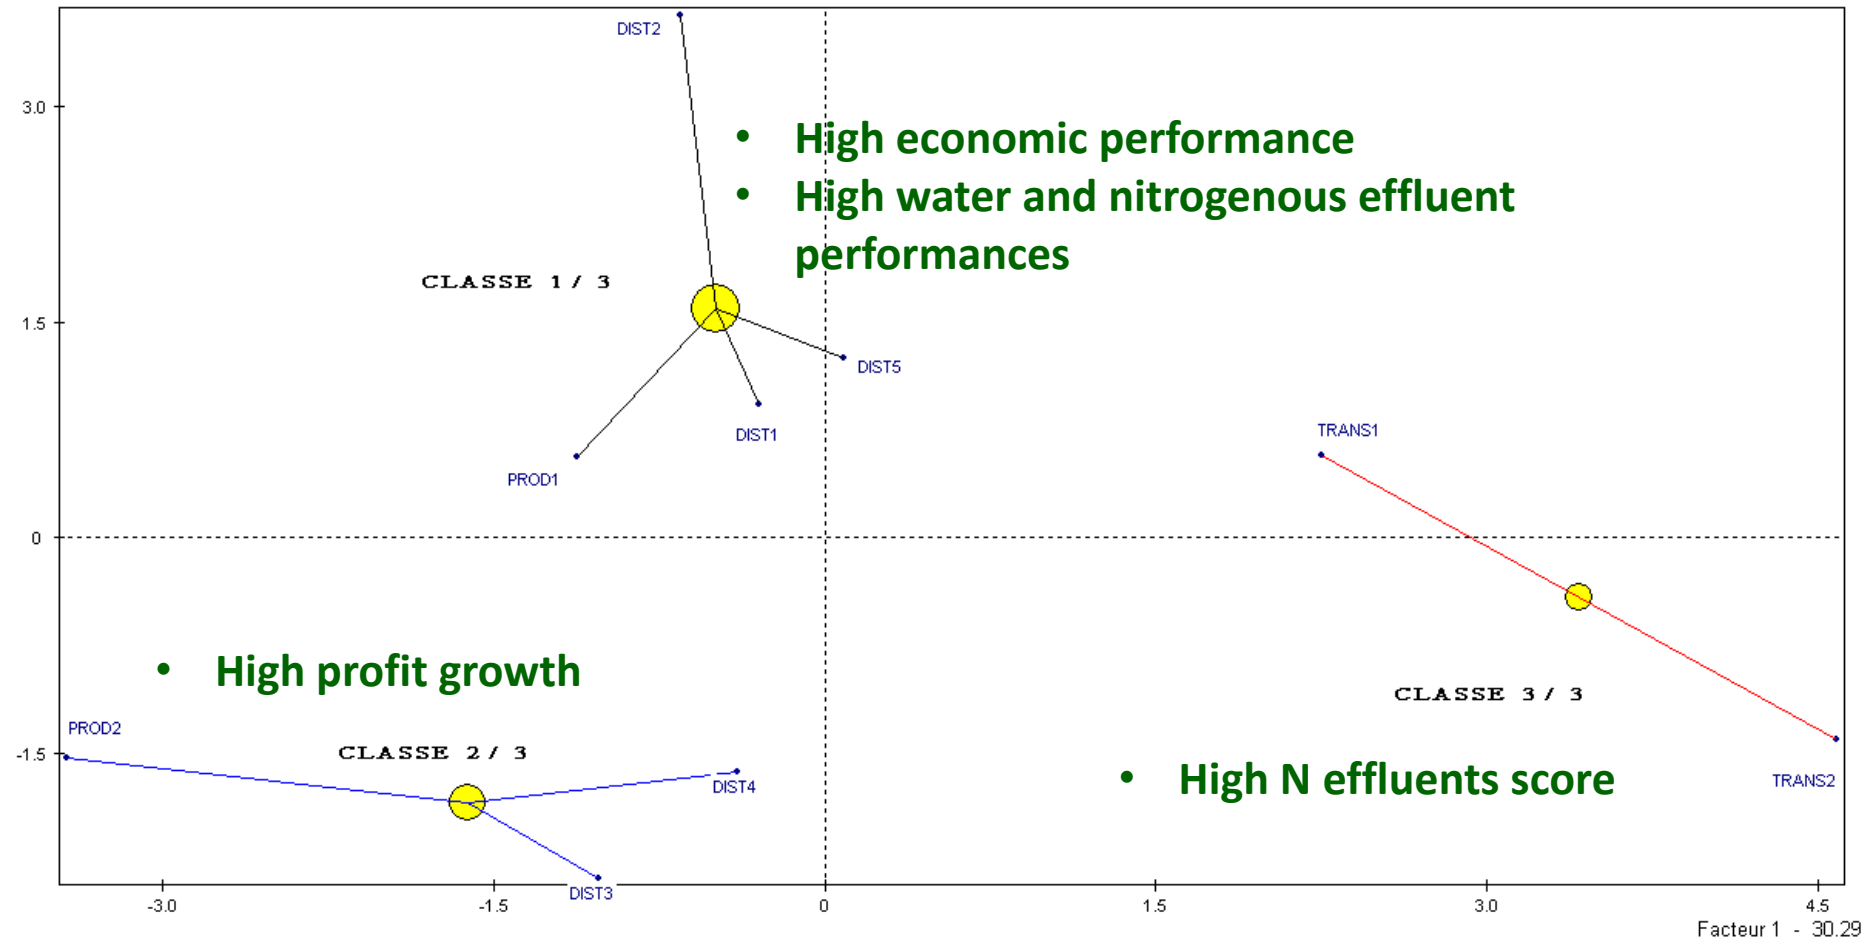

Sustainability performance evaluation of processor 2

2. Supply chain level group performance

3. Typology according to sustainability performances

Facteur 2 - 21.36 %

The system was able to:

1. Group supply chain actors into categories solely based on their sustainability performance
2. Quantify sustainability levels and provide scores
3. Offer a static description and a dynamic follow up of the supply chain's sustainability level
4. Offer a holistic approach and reveals the interaction between the different supply chain actors
5. Track sustainability weak sustainability scores to their origin

Use of the evaluation system

- Gathering and quantifying sustainability scores to help take agricultural policy decisions
- Transfer of results by specialised agricultural technicians to stakeholders in a simplified manner
- A fine balance between the accuracy of the information and the simplicity of its presentation

Perspectives

- Test the system on a broader scale to allow fine tuning the scores calculations
- Test the adaptability of the system by testing it in different countries with different production systems and weather conditions
- Automating the calculation system through adapted computer programs
